## DESCRIPTIONS

### **MODULE** OLS

	OLS
(DATASET(NumericField) X=empty_data, DATASET(NumericField) Y=empty_data)	

Ordinary Least Squares (OLS) Linear Regression aka Ordinary Linear Regression Regression learns a function that maps a set of input data (independents) to one or more output variables (dependents). The resulting learned function is known as the model. That model can then be used repetitively to predict (i.e. estimate) the output value(s) based on new input data. Two major use cases are supported: 1) Learn and return a model 2) Use an existing (e.g. persisted) model to predict new values for Y Of course, both can be done in a single run. Alternatively, the model can be persisted and used indefinitely for prediction of Y values, as long as the record format has not changed, and the original training data remains representative of the population. OLS supports any number of independent variables (Multiple Regression) and multiple dependent variables (Multivariate Regression). In this way, multiple variables' values can be predicted from the same input (i.e. independent) data. Training data is presented as parameters to this module. When using a previously persisted model (use case 2 above), these parameters should be omitted. This module provides a rich set of analytics to assess the usefulness of the resulting linear regression model, and to determine the best subset of independent variables to include in the model. These include: For the whole model: - Analysis of Variance (ANOVA) - R-squared - Adjusted R-squared - F-Test - Akaike Information Criterion (AIC) For each coefficient: - Standard Error (SE) -

**PARAMETER** X ||| TABLE ( NumericField ) — The independent variable training data in DATASET(NumericField) format. Each observation (e.g. record) is identified by 'id', and each feature is identified by field number (i.e. 'number'). Omit this parameter when predicting from a persisted model.

**PARAMETER** Y ||| TABLE ( NumericField ) — The dependent variable training data in DATASET(NumericField) format. Each observation (e.g. record) is identified by 'id', and each feature is identified by field number. Omit this parameter when predicting from a persisted model.

22. [FTestRec](#) : No Documentation Found
23. [FTest](#) : F-Test Calculate the P-value for the full regression, which is the probability that all of the coefficients are insignificant (i.e

---

## ATTRIBUTE GetModel

OLS \

<a href="#">DATASET(Layout_Model)</a>	<b>GetModel</b>
---------------------------------------	-----------------

GetModel Returns the learned model that maps X's to Y's. In the case of OLS, the model represents a set of Betas which are the coefficients of the linear model:  $\text{Beta0} * 1 + \text{Beta1} * \text{Field1} + \text{Beta2} * \text{Field2} \dots$  The ID of each model record specifies to which Y variable the coefficient applies. The Field Number ('number') indicates to which field of X the beta is to be applied. Field number 1 provides the intercept portion of the linear model and is always multiplied by 1. Note that if multiple work-items are provided within X and Y, there will be multiple models returned. The models can be separated by their work item id (i.e. 'wi'). A single model can be extracted from a myriad model by using e.g., `model(wi=myWI_id)`. GetModel should not be called when predicting using a previously persisted model (i.e. when training data was not passed to the module.

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , REAL8 value } ) — Model in DATASET(Layout\_Model) format

## OVERLOAD

**SEE** ML\_core/Types.Layout\_Model

## FUNCTION Betas

OLS \

<b>DATASET(NumericField)</b>	<b>Betas</b>
(DATASET(Layout_Model) model=GetModel)	

Return raw Beta values as numeric fields Extracts Beta values from the model. Can be used during training and prediction phases. For use during training phase, the 'model' parameter can be omitted. GetModel will be called to retrieve the model based on the training data. For use during prediction phase, a previously persisted model should be provided. The 'number' field of the returned NumericField records specifies to which Y the coefficient applies. The 'id' field of the returned record indicates the position of the Beta value. ID = 1 provides the Beta for the constant term (i.e. the Y intercept) while subsequent values reflect the Beta for each correspondingly numbered X feature. Feature 1 corresponds to Beta with 'id' = 2 and so on. If 'model' contains multiple work-items, Separate sets of Betas will be returned for each of the 'myriad' models (distinguished by 'wi').

**PARAMETER** model ||| TABLE ( Layout\_Model ) — Optional parameter provides a model that was previously retrieved using GetModel. If omitted, GetModel will be used as the model.

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , REAL8 value } ) — DATASET(NumericField) containing the Beta values.

---

## FUNCTION Predict

OLS \

<b>DATASET(NumericField)</b>	<b>Predict</b>
(DATASET(NumericField) newX, DATASET(Layout_Model) model=GetModel)	

Predict the dependent variable values (Y) for any set of independent variables (X). Returns a predicted Y values for each observation (i.e. record) of X. This supports the 'myriad' style interface in that multiple independent work items may be present in 'newX', and multiple independent models may be provided in 'model'. The resulting predicted values will also be separable by work item (i.e. wi).

**PARAMETER** newX ||| TABLE ( NumericField ) — The set of observations of independent variables in DATASET(NumericField) format.

**PARAMETER** model ||| TABLE ( Layout\_Model ) — Optional. A model that was previously returned from GetModel (above). Note that a model from a previous run will only be valid if the field numbers in X are the same as when the model was learned. If this parameter is omitted, the current model will be used.

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , REAL8 value } ) — An estimation of the corresponding Y value for each observation of newX. Returned in DATASET(NumericField) format with field number (i.e. 'number') indicating the dependent variable that is predicted.

## ATTRIBUTE RSquared

OLS \

DATASET(R2Rec)	RSquared
----------------	----------

RSquared Calculate the R-Squared Metric used to assess the fit of the regression line to the training data. Since the regression has chosen the best (i.e. least squared error) line matching the data, this can be thought of as a measurement of the linearity of the training data. R Squared generally varies between

0 and 1, with 1 indicating an exact linear fit, and 0 indicating that a linear fit will have no predictive power. Negative values are possible under certain conditions, and indicate that the mean(Y) will be more predictive than any linear fit. Moderate values of R squared (e.g. .5) may indicate that the relationship of X -> Y is non-linear, or that the measurement error is high relative to the linear correlation (e.g. many outliers). In the former case, increasing the dimensionality of X, such as by using polynomial variants of the features, may yield a better fit. R squared always increases when additional independent variables are added, so it should not be used to determine the optimal set of X variables to include. For that purpose, use Adjusted R Squared (below) which penalizes larger numbers of variables. Note that the result of this call is only meaningful during training phase (use case 1 above) as it is an analysis based on the training data which is not provided during a prediction-only phase.

**RETURN** TABLE ( { UNSIGNED2 **wi** , UNSIGNED4 **number** , REAL8 **RSquared** } ) — DATASET(R2Rec) with one record per dependent variable, per work-item. The number field indicates the dependent variable and corresponds to the number field of the dependent (Y) variable to which it applies.

## **ATTRIBUTE** Anova

OLS \

Anova
-------

ANOVA (Analysis of Variance) report Analyzes the sources of variance. Basic ANOVA equality: Model + Error = Total Determines how much of the variance of Y is explained by the regression model, versus how much is due to the error term (i.e. unexplained variance). This attribute is only meaningful during the training phase. Provides one record per work-item. Each record provides the following statistics: - Total\_SS – Total Sum of Squares (SS) variance of the dependent data - Model\_SS – The SS variance represented within the model - Error\_SS – The SS variance not reflected by the model (i.e. Total\_SS - Error\_SS) - Total\_DF – The total degrees of freedom within the dependent data - Model\_DF – Degrees of freedom of the model - Error\_DF – Degrees of freedom of the error component - Total\_MS – The Mean Square (MS) variance of the dependent data - Model\_MS – The Mean Square (MS) variance represented within the model - Error\_MS – The MS variance not reflected by the model - Model\_F – The F-Test statistic: Model\_MS / Error\_MS

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED4 number , REAL8 Total\_SS ,  
REAL8 Model\_SS , REAL8 Error\_SS , UNSIGNED8 Total\_DF , UNSIGNED8

Model\_DF , UNSIGNED8 Error\_DF , REAL8 Total\_MS , REAL8 Model\_MS , REAL8 Error\_MS , REAL8 Model\_F } ) — DATASET(AnovaRec), one per work-item per dependent (Y) variable The number field indicates the dependent variable to which the analysis applies.

---

## ATTRIBUTE SE

OLS \

DATASET(NumericField)	SE
-----------------------	----

Standard Error of the Regression Coefficients Describes the variability of the regression error for each coefficient. Only meaningful during the training phase.

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , REAL8 value } ) — DATASET(NumericField), one record per Beta coefficient per dependent variable per work-item. The 'id' field is the coefficient number, with 1 being the Y intercept, 2 being the coefficient for the first feature, etc. The 'number' field indicates the dependent variable to which the coefficient applies.

---

## ATTRIBUTE TStat

OLS \

DATASET(NumericField)	TStat
-----------------------	-------

T-Statistic The T-statistic identifies the significance of the value of each regression coefficient. Its calculation is simply the value of the coefficient divided by the Standard Error of the coefficient. A larger absolute value of the T-statistic indicates that the coefficient is more significant. Only meaningful during the training phase.

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , REAL8 value } ) — DATASET(NumericField), one record per Beta coefficient per dependent variable per work-item. The 'id' field is the coefficient number, with 1 being the Y intercept, 2 being the coefficient for the first feature, etc. The number field indicates the dependent variable to which the coefficient applies.

---

## ATTRIBUTE AdjRSquared

OLS \

DATASET(R2Rec)	AdjRSquared
----------------	-------------

Adjusted R2 Calculate Adjusted R Squared which is a scaled version of R Squared that does not arbitrarily increase with the number of features. Adjusted R2, rather than R2 should always be used when trying to determine the best set of features to include in a model. When adding features, R2 will always increase, whether or not it improves the predictive power of the model. Adjusted R2, however, will only increase with the predictive power of the model.

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED4 number , REAL8 RSquared } ) — DATASET(R2Rec), one record per dependent variable per work-item. The number field indicates the dependent variable and corresponds to the number field of the dependent (Y) variable to which it applies.

---

## ATTRIBUTE pVal

OLS \

	pVal
--	------

P-Value Calculate the P-value for each coefficient, which is the probability that the coefficient is insignificant (i.e. actually zero). A low P-value (e.g. .05) provides evidence that the coefficient is significant in the model. A high P-value indicates that the coefficient value should, in fact, be zero. P-value is related to the T-Statistic, and can be thought of as a normalized version of the T-Statistic. Only meaningful during the training phase.

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , REAL8 value } ) — DATSET(NumericField), one record per Beta coefficient per dependent variable per work-item. The 'id' field is the coefficient number, with 1 being the Y intercept, 2 being the coefficient for the first feature, etc. The number field indicates the dependent variable and corresponds to the number field of the dependent (Y) variable to which it applies.

## FUNCTION **ConfInt**

OLS \

<b>ConfInt</b>
(Types.t_fieldReal level)

**Confidence Interval** The Confidence Interval determines the upper and lower bounds of each estimated coefficient given a confidence level (level) that is required. For example, one could say that there is a 95% probability (level) that the coefficient of the first independent variable is between 2.05 and 3.62. This allows error margins to be determined with the desired confidence level. If the confidence interval spans zero, it implies that the coefficient may not be significant at the specified confidence level.

**PARAMETER** level ||| REAL8 — The level of confidence required, expressed as a percentage from 0.0 to 100.0

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , REAL8 LowerInt , REAL8 UpperInt } ) — DATASET(ConfIntRec) with one record per coefficient per dependent variable per work-item. The 'id' field is the coefficient number, with 1 being the Y intercept, 2 being the coefficient for the first feature, etc. The number field indicates the dependent variable and corresponds to the number field of the dependent (Y) variable to which it applies.

## RECORD **FTestRec**

OLS \

<b>FTestRec</b>
-----------------

No Documentation Found

**FIELD** number ||| UNSIGNED4 — No Doc

**FIELD** wi ||| UNSIGNED2 — No Doc

**FIELD** model\_\_f ||| REAL8 — No Doc

**FIELD** pvalue ||| REAL8 — No Doc

## ATTRIBUTE FTest

OLS \

<b>DATASET(FTestRec)</b>	<b>FTest</b>
--------------------------	--------------

F-Test Calculate the P-value for the full regression, which is the probability that all of the coefficients are insignificant (i.e. actually zero). A low P-value (e.g. .05) provides evidence that at least one coefficient is significant. A high P-value indicates that all the coefficient values should in fact be zero, implying that the regression has no statistically significant predictive power. P-value is related to the ANOVA F-Statistic, and can be thought of as a standardized version of the ANOVA F-Statistic. The F-Test and T-Test are similar, except that the T-test is used to test the significance of each coefficient, while the F-Test is used to test the significance of the entire regression. For simple linear regression (i.e. only one independent variable, the T-Test and F-Test are equivalent.

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED4 number , REAL8 Model\_F ,  
REAL8 pValue } ) — DATASET(FTestRec), one record per dependent variable per work-item.  
The number field indicates the dependent variable and corresponds to the number field of the  
dependent (Y) variable to which it applies.

## DESCRIPTIONS

### **FUNCTION** BinomialConfusion

<code>DATASET(Types.Binomial_Confusion_Summary)</code>	BinomialConfusion
<code>(DATASET(Core_Types.Confusion_Detail) d)</code>	

Binomial confusion matrix. Work items with multinomial responses are ignored by this function. The higher value lexically is considered to be the positive indication.

**PARAMETER** `d` ||| TABLE ( Confusion\_Detail ) — confusion detail for the work item and classifier

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED4 classifier , UNSIGNED8 true\_positive , UNSIGNED8 true\_negative , UNSIGNED8 false\_positive , UNSIGNED8 false\_negative , UNSIGNED8 cond\_pos , UNSIGNED8 pred\_pos , UNSIGNED8 cond\_neg , UNSIGNED8 pred\_neg , REAL8 prevalence , REAL8 accuracy , REAL8 true\_pos\_rate , REAL8 false\_neg\_rate , REAL8 false\_pos\_rate , REAL8 true\_neg\_rate , REAL8 pos\_pred\_val , REAL8 false\_disc\_rate , REAL8 false\_omit\_rate , REAL8 neg\_pred\_val } ) — confusion matrix for a binomial classifier

## DESCRIPTIONS

### **MODULE** BinomialLogisticRegression

	<b>BinomialLogisticRegression</b>
	(UNSIGNED max_iter=200, REAL8 epsilon=Constants.default_epsilon, REAL8 ridge=Constants.default_ridge)

Binomial logistic regression using iteratively re-weighted least squares.

**PARAMETER** max\_iter ||| UNSIGNED8 — maximum number of iterations to try

**PARAMETER** epsilon ||| REAL8 — the minimum change in the Beta value estimate to continue

**PARAMETER** ridge ||| REAL8 — a value to populate a diagonal matrix that is added to a matrix help assure that the matrix is invertible.

**PARENT** ML\_Core.Interfaces.IClassify <../ML\_Core/Interfaces/IClassify.ecl.tex>

Children

## FUNCTION Normal\_CDF

[Distributions](#) \

REAL8	Normal_CDF
(REAL8 x)	

Cumulative Distribution of the standard normal distribution, the probability that a normal random variable will be smaller than x standard deviations above or below the mean. Taken from C/C++ Mathematical Algorithms for Scientists and Engineers, n. Shamma, McGraw-Hill, 1995

**PARAMETER** x ||| REAL8 — the number of standard deviations

**RETURN** REAL8 —

**RETURNS** probability of exceeding x.

---

## FUNCTION Normal\_PPF

[Distributions](#) \

REAL8	Normal_PPF
(REAL8 x)	

Normal Distribution Percentage Point Function. Translated from C/C++ Mathematical Algorithms for Scientists and Engineers, N. Shamma, McGraw-Hill, 1995

**PARAMETER** x ||| REAL8 — probability

**RETURN** REAL8 —

**RETURNS** number of standard deviations from the mean

---

## FUNCTION T\_CDF

[Distributions](#) \

REAL8	T_CDF
(REAL8 x, REAL8 df)	

Students t distribution integral evaluated between negative infinity and x. Translated from NIST SEL DATAPAC Fortran TCDF.f source

**PARAMETER** x ||| REAL8 — value of the evaluation

**PARAMETER** df ||| REAL8 — degrees of freedom

**RETURN** REAL8 —

**RETURNS** the probability that a value will be less than the specified value

---

## FUNCTION T\_PPF

[Distributions](#) \

REAL8	T_PPF
(REAL8 x, REAL8 df)	

Percentage point function for the T distribution. Translated from NIST SEL DATAPAC Fortran TPPF.f source

**PARAMETER** x ||| REAL8 — No Doc

**PARAMETER** df ||| REAL8 — No Doc

**RETURN** REAL8 —

---

## FUNCTION Chi2\_CDF

[Distributions \](#)

REAL8	Chi2_CDF
(REAL8 <u>x</u> , REAL8 <u>df</u> )	

The cumulative distribution function for the Chi Square distribution. the CDF for the specied degrees of freedom. Translated from the NIST SEL DATAPAC Fortran subroutine CHSCDF.

**PARAMETER** x ||| REAL8 — No Doc

**PARAMETER** df ||| REAL8 — No Doc

**RETURN** REAL8 —

---

## FUNCTION Chi2\_PPF

[Distributions \](#)

REAL8	Chi2_PPF
(REAL8 <u>x</u> , REAL8 <u>df</u> )	

The Chi Squared PPF function. Translated from the NIST SEL DATAPAC Fortran subroutine CHSPPF.

**PARAMETER** x ||| REAL8 — No Doc

**PARAMETER** df ||| REAL8 — No Doc

**RETURN** REAL8 —

---

## DESCRIPTIONS

### **FUNCTION** GetModel

<code>DATASET(Layout_Model)</code>	<code>GetModel</code>
<pre>(DATASET(NumericField) independents, DATASET(DiscreteField) dependents, UNSIGNED max_iter=200, REAL8 epsilon=Constants.default_epsilon, REAL8 ridge=Constants.default_ridge)</pre>	

Generate logistic regression model from training data. The size of the inputs is used to determine which work items are processed with purely local operations (the data is moved once as necessary) or with global operations supporting a work item to use multiple nodes.

**PARAMETER** `independents` ||| TABLE ( NumericField ) — the independent values

**PARAMETER** `max_iter` ||| UNSIGNED8 — maximum number of iterations to try

**PARAMETER** `epsilon` ||| REAL8 — the minimum change in the Beta value estimate to continue

**PARAMETER** `dependents` ||| TABLE ( DiscreteField ) — the dependent values.

**PARAMETER** ridge ||| REAL8 — a value to pupulate a diagonal matrix that is added to a matrix help assure that the matrix is invertible.

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , REAL8 value } ) — coefficient matrix plus model building stats

## DESCRIPTIONS

### **MODULE** IClassify

IClassify
-----------

Interface definition for Classification. Actual implementation modules will probably take parameters.

### Children

1. [GetModel](#) : Calculate the model to fit the observation data to the observed classes
2. [Classify](#) : Classify the observations using a model
3. [Report](#) : Report the confusion matrix for the classifier and training data

---

### **FUNCTION** GetModel

[IClassify](#) \

<b>DATASET</b> (Types.Layout_Model)	<b>GetModel</b>
(DATASET(Types.NumericField) observations, DATASET(Types.DiscreteField) classifications)	

Calculate the model to fit the observation data to the observed classes.

**PARAMETER** classifications ||| TABLE ( DiscreteField ) — the observed classification used to build the model

**PARAMETER** observations ||| TABLE ( NumericField ) — the observed explanatory values

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , REAL8 value } ) — the encoded model

---

## FUNCTION Classify

IClassify \

<b>DATASET</b> (Types.Classify_Result)	<b>Classify</b>
(DATASET(Types.Layout_Model) model, DATASET(Types.NumericField) new_observations)	

Classify the observations using a model.

**PARAMETER** new\_observations ||| TABLE ( NumericField ) — observations to be classified

**PARAMETER** model ||| TABLE ( Layout\_Model ) — The model, which must be produced by a corresponding getModel function.

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , INTEGER4 value , REAL8 conf } ) — Classification with a confidence value

---

## FUNCTION Report

IClassify \

<code>DATASET(Types.Confusion_Detail)</code>	<b>Report</b>
<code>(DATASET(Types.Layout_Model) model,  DATASET(Types.NumericField) observations,  DATASET(Types.DiscreteField) classifications)</code>	

Report the confusion matrix for the classifier and training data.

**PARAMETER** classifications ||| TABLE ( DiscreteField ) — the classifications associated with the observations

**PARAMETER** observations ||| TABLE ( NumericField ) — the explanatory values.

**PARAMETER** model ||| TABLE ( Layout\_Model ) — the encoded model

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED4 classifier , INTEGER4 actual\_class , INTEGER4 predict\_class , UNSIGNED4 occurs , BOOLEAN correct } ) — the confusion matrix showing correct and incorrect results

---

# ML\_Core/ Interfaces/ IRegression

## DESCRIPTIONS

### **MODULE** IRegression

IRegression
(DATASET(NumericField) X=empty_data, DATASET(NumericField) Y=empty_data)

Interface Definition for Regression Modules Regression learns a function that maps a set of input data to one or more output variables. The resulting learned function is known as the model. That model can then be used repetitively to predict (i.e. estimate) the output value(s) based on new input data.

**PARAMETER** X ||| TABLE ( NumericField ) — The independent data in DATASET(NumericField) format. Each statistical unit (e.g. record) is identified by 'id', and each feature is identified by field number (i.e. 'number').

**PARAMETER** Y ||| TABLE ( NumericField ) — The dependent variable(s) in DATASET(NumericField) format. Each statistical unit (e.g. record) is identified by 'id', and each feature is identified by field number (i.e. 'number').

### Children

1. [GetModel](#) : Calculate and return the 'learned' model The model may be persisted and later used to make predictions using 'Predict' below

2. **Predict** : Predict the output variable(s) based on a previously learned model

---

## ATTRIBUTE GetModel

IRegression \

DATASET(Layout_Model)	GetModel
-----------------------	----------

Calculate and return the 'learned' model The model may be persisted and later used to make predictions using 'Predict' below.

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , REAL8 value } ) — DATASET(LayoutModel) describing the learned model parameters

---

## FUNCTION Predict

IRegression \

DATASET(NumericField)	Predict
(DATASET(NumericField) newX, DATASET(Layout_Model) model)	

Predict the output variable(s) based on a previously learned model

**PARAMETER** newX ||| TABLE ( NumericField ) — DATASET(NumericField) containing the X values to b predicted.

**PARAMETER** model ||| TABLE ( Layout\_Model ) — No Doc

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , REAL8 value } ) — DATASET(NumericField) containing one entry per observation (i.e. id) in newX.  
This represents the predicted values for Y.

### **MODULE** Distributions

	Distributions
--	---------------

No Documentation Found

### Children

1. [Normal\\_CDF](#) : Cumulative Distribution of the standard normal distribution, the probability that a normal random variable will be smaller than x standard deviations above or below the mean
2. [Normal\\_PPF](#) : Normal Distribution Percentage Point Function
3. [T\\_CDF](#) : Students t distribution integral evaluated between negative infinity and x
4. [T\\_PPF](#) : Percentage point function for the T distribution
5. [Chi2\\_CDF](#) : The cumulative distribution function for the Chi Square distribution
6. [Chi2\\_PPF](#) : The Chi Squared PPF function

## FUNCTION Normal\_CDF

[Distributions](#) \

REAL8	Normal_CDF
(REAL8 x)	

Cumulative Distribution of the standard normal distribution, the probability that a normal random variable will be smaller than x standard deviations above or below the mean. Taken from C/C++ Mathematical Algorithms for Scientists and Engineers, n. Shamma, McGraw-Hill, 1995

**PARAMETER** x ||| REAL8 — the number of standard deviations

**RETURN** REAL8 —

**RETURNS** probability of exceeding x.

---

## FUNCTION Normal\_PPF

[Distributions](#) \

REAL8	Normal_PPF
(REAL8 x)	

Normal Distribution Percentage Point Function. Translated from C/C++ Mathematical Algorithms for Scientists and Engineers, N. Shamma, McGraw-Hill, 1995

**PARAMETER** x ||| REAL8 — probability

**RETURN** REAL8 —

**RETURNS** number of standard deviations from the mean

---

## FUNCTION T\_CDF

[Distributions](#) \

REAL8	T_CDF
(REAL8 x, REAL8 df)	

Students t distribution integral evaluated between negative infinity and x. Translated from NIST SEL DATAPAC Fortran TCDF.f source

**PARAMETER** x ||| REAL8 — value of the evaluation

**PARAMETER** df ||| REAL8 — degrees of freedom

**RETURN** REAL8 —

**RETURNS** the probability that a value will be less than the specified value

---

## FUNCTION T\_PPF

[Distributions](#) \

REAL8	T_PPF
(REAL8 x, REAL8 df)	

Percentage point function for the T distribution. Translated from NIST SEL DATAPAC Fortran TPPF.f source

**PARAMETER** x ||| REAL8 — No Doc

**PARAMETER** df ||| REAL8 — No Doc

**RETURN** REAL8 —

---

## FUNCTION Chi2\_CDF

[Distributions \](#)

REAL8	Chi2_CDF
(REAL8 <u>x</u> , REAL8 <u>df</u> )	

The cumulative distribution function for the Chi Square distribution. the CDF for the specfied degrees of freedom. Translated from the NIST SEL DATAPAC Fortran subroutine CHSCDF.

**PARAMETER** x ||| REAL8 — No Doc

**PARAMETER** df ||| REAL8 — No Doc

**RETURN** REAL8 —

---

## FUNCTION Chi2\_PPF

[Distributions \](#)

REAL8	Chi2_PPF
(REAL8 <u>x</u> , REAL8 <u>df</u> )	

The Chi Squared PPF function. Translated from the NIST SEL DATAPAC Fortran subroutine CHSPPF.

**PARAMETER** x ||| REAL8 — No Doc

**PARAMETER** df ||| REAL8 — No Doc

**RETURN** REAL8 —

---

# ML\_Core/ Math/ DoubleFac

---

[Go Up](#)

## DESCRIPTIONS

### **EMBED** DoubleFac

<b>REAL8</b>	DoubleFac
(INTEGER2 i)	

The 'double' factorial is defined for ODD n and is the product of all the odd numbers up to and including that number. We are extending the meaning to even numbers to mean the product of the even numbers up to and including that number. Thus  $\text{DoubleFac}(8) = 8*6*4*2$  We also defend against  $i < 2$  (returning 1.0)

**PARAMETER** *i* ||| INTEGER2 — the value used in the calculation

**RETURN** **REAL8** — the factorial of the sequence, declining by 2

---

# ML\_Core/ Math/ Fac

---

[Go Up](#)

## DESCRIPTIONS

### **EMBED** Fac

<b>REAL8</b>	Fac
(UNSIGNED2 i)	

Factorial function

**PARAMETER** **i** ||| UNSIGNED2 — the value used, (i)(i-1)(i-2) . . . (2)

**RETURN** **REAL8** — the factorial i!

---

## ML\_Core/ Math/ gamma

---

[Go Up](#)

### DESCRIPTIONS

#### **EMBED** gamma

<b>REAL8</b>	gamma
(REAL8 x)	

Return the value of gamma function of real number x A wrapper for the standard C tgamma function.

**PARAMETER** x ||| REAL8 — the input x

**RETURN** REAL8 — the value of GAMMA evaluated at x

---

# ML\_Core/ Math/ log\_gamma

---

[Go Up](#)

## DESCRIPTIONS

### **EMBED** log\_gamma

<b>REAL8</b>	log_gamma
(REAL8 x)	

Return the value of the log gamma function of the absolute value of X. A wrapper for the standard C lgamma function. Avoids the race condition found on some platforms by taking the absolute value of the of the input argument.

**PARAMETER** x ||| REAL8 — the input x

**RETURN** **REAL8** — the value of the log of the GAMMA evaluated at ABS(x)

---

# ML\_Core/ Math/ lowerGamma

---

[Go Up](#)

## DESCRIPTIONS

### EMBED lowerGamma

REAL8	lowerGamma
(REAL8 x, REAL8 y)	

Return the lower incomplete gamma value of two real numbers, x and y

**PARAMETER** x ||| REAL8 — the value of the first number

**PARAMETER** y ||| REAL8 — the value of the second number

**RETURN** REAL8 — the lower incomplete gamma value

---

# ML\_Core/ Math/ NCK

---

[Go Up](#)

## IMPORTS

ML\_Core.Math |

## DESCRIPTIONS

### **FUNCTION** NCK

<b>REAL8</b>	NCK
(INTEGER2 N, INTEGER2 K)	

No Documentation Found

**PARAMETER** n ||| INTEGER2 — No Doc

**PARAMETER** k ||| INTEGER2 — No Doc

**RETURN** REAL8 —

---

# ML\_Core/ Math/ Poly

---

[Go Up](#)

## DESCRIPTIONS

### EMBED Poly

REAL8	Poly
(REAL8 x, SET OF REAL8 Coeffs)	

Evaluate a polynomial from a set of co-effs. Co-effs 1 is assumed to be the HIGH order of the equation. Thus for  $ax^2+bx+c$  - the set would need to be  $\text{Coef} := [a,b,c]$ ;

**PARAMETER** x ||| REAL8 — the value of x in the polynomial

**PARAMETER** Coeffs ||| SET ( REAL8 ) — a set of coefficients for the polynomial. The ALL set is considered to be all zero values

**RETURN** REAL8 — value of the polynomial at x

---

# ML\_Core/ Math/ StirlingFormula

---

[Go Up](#)

## IMPORTS

ML\_Core.Math | ML\_Core.Constants |

## DESCRIPTIONS

### **FUNCTION** StirlingFormula

	StirlingFormula
(REAL x)	

Stirling's formula

**PARAMETER** x ||| REAL8 — the point of evaluation

**RETURN** REAL8 — evaluation result

---

# ML\_Core/ Math/ upperGamma

---

[Go Up](#)

## DESCRIPTIONS

### EMBED upperGamma

REAL8	upperGamma
(REAL8 x, REAL8 y)	

Return the upper incomplete gamma value of two real numbers, x and y.

**PARAMETER** x ||| REAL8 — the value of the first number

**PARAMETER** y ||| REAL8 — the value of the second number

**RETURN** REAL8 — the upper incomplete gamma value

---

## ML\_Core/ Utils/ Gini

---

[Go Up](#)

### DESCRIPTIONS

#### **MACRO** Gini

Gini
<code>(infile, pivot, target, wi_name='wi')</code>

Creates a file of pivot/target pairs with a Gini impurity value.

**PARAMETER** infile ||| INTEGER8 — the input file, any type with a work item field

**PARAMETER** pivot ||| INTEGER8 — the name of the pivot field

**PARAMETER** target ||| INTEGER8 — the name of the field used as the target

**PARAMETER** wi\_name ||| INTEGER8 — the name of the work item field, default is "wi" return A table by Work Item and Pivot value giving count and Gini impurity value

**RETURN** BOOLEAN —

---

# ML\_Core/ Utils/ SequenceInField

---

[Go Up](#)

## DESCRIPTIONS

### MACRO SequenceInField

SequenceInField
<code>(infile,infield,seq,wi_name='wi')</code>

Given a file which is sorted by the work item identifier and INFIELD (and possibly other values), add sequence numbers within the range of each infield. Slightly elaborate code is to avoid having to partition the data to one value of infield per node and to work with very large numbers of records where a global count project would be inappropriate. This is useful for assigning rank positions with the groupings.

**PARAMETER** infield ||| INTEGER8 — field name of grouping field

**PARAMETER** infile ||| INTEGER8 — the input file, any type

**PARAMETER** seq ||| INTEGER8 — name of the field to receive the sequence number

**PARAMETER** wi\_name ||| INTEGER8 — work item field name, default is wi

**RETURN** **BOOLEAN** — a file of the same type with sequence numbers applied

### **MODULE** Converted

	Converted
--	-----------

Module to convert between ML\_Core/Types Field layouts (i.e. NumericField and DiscreteField) and PBblas matrix layout (i.e. Layout\_Cell)

### Children

1. [NFToMatrix](#) : Convert NumericField dataset to Matrix
2. [DFToMatrix](#) : Convert DiscreteField dataset to Matrix
3. [MatrixToNF](#) : Convert Matrix to NumericField dataset
4. [MatrixToDF](#) : Convert Matrix to DiscreteField dataset

## FUNCTION NFToMatrix

Converted \

<code>DATASET(Layout_Cell)</code>	<code>NFToMatrix</code>
<code>(DATASET(NumericField) recs)</code>	

Convert NumericField dataset to Matrix

**PARAMETER** `recs` ||| TABLE ( NumericField ) — Record Dataset in DATASET(NumericField) format

**RETURN** TABLE ( { UNSIGNED2 wi\_id , UNSIGNED4 x , UNSIGNED4 y , REAL8 v } ) — Matrix in DATASET(Layout\_Cell) format

**SEE** PBblas/Types.Layout\_Cell

**SEE** ML\_Core/Types.NumericField

---

## FUNCTION DFToMatrix

Converted \

<code>DATASET(Layout_Cell)</code>	<code>DFToMatrix</code>
<code>(DATASET(DiscreteField) recs)</code>	

Convert DiscreteField dataset to Matrix

**PARAMETER** `recs` ||| TABLE ( DiscreteField ) — Record Dataset in DATASET(DiscreteField) format

**RETURN** TABLE ( { UNSIGNED2 wi\_id , UNSIGNED4 x , UNSIGNED4 y , REAL8 v } ) — Matrix in DATASET(Layout\_Cell) format

**SEE** PBblas/Types.Layout\_Cell

**SEE** ML\_Core/Types.DiscreteField

## FUNCTION MatrixToNF

Converted \

DATASET(NumericField)	MatrixToNF
(DATASET(Layout_Cell) mat)	

Convert Matrix to NumericField dataset

**PARAMETER** mat ||| TABLE ( Layout\_Cell ) — Matrix in DATASET(Layout\_Cell) format

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , REAL8 value } ) — NumericField Dataset

**SEE** PBblas/Types.Layout\_Cell

**SEE** ML\_Core/Types.NumericField

---

## FUNCTION MatrixToDF

Converted \

DATASET(DiscreteField)	MatrixToDF
(DATASET(Layout_Cell) mat)	

Convert Matrix to DiscreteField dataset

**PARAMETER** mat ||| TABLE ( Layout\_Cell ) — Matrix in DATASET(Layout\_Cell) format

**RETURN** TABLE ( { UNSIGNED2 wi , UNSIGNED8 id , UNSIGNED4 number , INTEGER4 value } ) — DiscreteField Dataset

**SEE** PBblas/Types.Layout\_Cell

**SEE** ML\_Core/Types.DiscreteField

## DESCRIPTIONS

### **FUNCTION** ExtractTri

<b>DATASET</b> (Layout_Cell)	<b>ExtractTri</b>
(Triangle tri, Diagonal dt, DATASET(Layout_Cell) A)	

Extract the upper or lower triangle from the composite output from getrf (LU Factorization).

**PARAMETER** **tri** ||| UNSIGNED1 — Triangle type: Upper or Lower (see Types.Triangle)

**PARAMETER** **A** ||| TABLE ( Layout\_Cell ) — Matrix of cells. See Types.Layout\_Cell

**PARAMETER** **dt** ||| UNSIGNED1 — Diagonal type: Unit or non unit (see Types.Diagonal)

**RETURN** TABLE ( { UNSIGNED2 wi\_id , UNSIGNED4 x , UNSIGNED4 y , REAL8 v }  
 ) — Matrix of cells in Layout\_Cell format representing a triangular matrix (upper or lower)

**SEE** Std.PBblas.Types

PBblas.internal.MatDims | std.system.Thorlib |

## DESCRIPTIONS

### **FUNCTION** `gemm`

<code>DATASET(Layout_Cell)</code>	<code>gemm</code>
<code>(BOOLEAN transposeA, BOOLEAN transposeB, value_t alpha, DATASET(Layout_Cell) A_in, DATASET(Layout_Cell) B_in, DATASET(Layout_Cell) C_in=emptyC, value_t beta=0.0)</code>	

Extended Parallel Block Matrix Multiplication Module Implements:  $\text{Result} = \alpha * \text{op}(\text{A})\text{op}(\text{B}) + \beta * \text{C}$ . op is No Transpose or Transpose. Multiplies two matrixes A and B, with an optional pre-multiply transpose for each Optionally scales the product by the scalar "alpha". Then adds an optional C matrix to the product after scaling C by the scalar "beta". A, B, and C are specified as DATASET(Layout\_Cell), as is the Resulting matrix. Layout\_Cell describes a sparse matrix stored as a list of x, y, and value. This interface also provides a "Myriad" capability allowing multiple similar operations to be performed on independent sets of matrixes in parallel. This is done by use of the work-item id (wi\_id) in each cell of the matrixes. Cells with the same wi\_id are considered part of the same matrix. In the myriad form, each input matrix A, B, and (optionally) C can contain many independent matrixes. The wi\_ids are matched up such that each operation involves the A, B, and C with the same wi\_id. A and B must therefore contain the same set of wi\_ids, while C is optional for any wi\_id. The same parameters: alpha, beta, transposeA, and transposeB are used for all work-items. The result will contain cells from all provided work-items. Result has same shape as C if provided. Note that matrixes are not explicitly

dimensioned. The shape is determined by the highest value of x and y for each work-item.

**PARAMETER** alpha ||| REAL8 — Scalar multiplier for  $\alpha * A * B$

**PARAMETER** A\_in ||| TABLE ( Layout\_Cell ) — 'A' matrix (multiplier) in Layout\_Cell format

**PARAMETER** beta ||| REAL8 — A scalar multiplier for  $\beta * C$ , scales the C matrix before addition. May be omitted.

**PARAMETER** B\_in ||| TABLE ( Layout\_Cell ) — Same as above for the 'B' matrix (multiplicand)

**PARAMETER** transposeA ||| BOOLEAN — Boolean indicating whether matrix A should be transposed before multiplying

**PARAMETER** C\_in ||| TABLE ( Layout\_Cell ) — Same as above for the 'C' matrix (addend). May be omitted.

**PARAMETER** transposeB ||| BOOLEAN — Same as above but for matrix B

**RETURN** TABLE ( { UNSIGNED2 wi\_id , UNSIGNED4 x , UNSIGNED4 y , REAL8 v } ) — Result matrix in Layout\_Cell format.

**SEE** PBblas/Types.Layout\_Cell

## DESCRIPTIONS

### FUNCTION `getrf`

<code>DATASET(Layout_Cell)</code>	<code>getrf</code>
<code>(DATASET(Layout_Cell) A)</code>	

LU Factorization Splits a matrix into Lower and Upper triangular factors Produces composite LU matrix for the diagonal blocks. Iterates through the matrix a row of blocks and column of blocks at a time. Partition A into M block rows and N block columns. The A11 cell is a single block. A12 is a single row of blocks with N-1 columns. A21 is a single column of blocks with M-1 rows. A22 is a sub-matrix of M-1 x N-1 blocks. | A11 A12 | | L11 0 | | U11 U12 | | A21 A22 | == | L21 L22 | \* | 0 U22 | | L11\*U11 L11\*U12 | == | L21\*U11 L21\*U12 + L22\*U22 | Based upon PB-BLAS: A set of parallel block basic linear algebra subprograms by Choi and Dongarra This module supports the "Myriad" style interface, allowing many independent problems to be worked on at once. The A matrix can contain multiple matrixes to be factored, indicated by different values for work-item id (wi\_id). Note: The returned matrix includes both the upper and lower factors. This matrix can be used directly by trsm which will only use the part indicated by trsm's 'triangle' parameter (i.e. upper or lower). To extract the upper or lower triangle explicitly for other purposes, use the ExtractTri function. When passing the Lower matrix to the triangle solver (trsm), set the "Diagonal" parameter to "UnitTri". This is necessary because both triangular matrixes returned from this function are packed into a square matrix with only one diagonal. By convention, The Lower triangle is assumed to be a Unit Triangle (diagonal all ones), so the diagonal

contained in the returned matrix is for the Upper factor and must be ignored (i.e. assumed to be all ones) when referencing the Lower triangle.

**PARAMETER** **A** ||| TABLE ( Layout\_Cell ) — The input matrix in Types.Layout\_Cell format

**RETURN** TABLE ( { UNSIGNED2 wi\_id , UNSIGNED4 x , UNSIGNED4 y , REAL8 v }  
 ) — Resulting factored matrix in Layout\_Cell format

## DESCRIPTIONS

### **FUNCTION** HadamardProduct

<b>DATASET</b> (Layout_Cell)	<b>HadamardProduct</b>
(DATASET(Layout_Cell) X, DATASET(Layout_Cell) Y)	

Element-wise multiplication of  $X * Y$ . Supports the "myriad" style interface – X and Y may contain multiple separate matrixes. Each X will be multiplied by the Y with the same work-item id. Note: This performs element-wise multiplication. For dot-product matrix multiplication, use PBblas.gemm.

**PARAMETER** X ||| TABLE ( Layout\_Cell ) — A matrix (or multiple matrices) in Layout\_Cell form

**PARAMETER** Y ||| TABLE ( Layout\_Cell ) — A matrix (or multiple matrices) in Layout\_Cell form

**RETURN** TABLE ( { UNSIGNED2 wi\_id , UNSIGNED4 x , UNSIGNED4 y , REAL8 v }  
) — A matrix (or multiple matrices) in Layout\_Cell form

### **MODULE** MatUtils

MatUtils
----------

Provides various utility attributes for manipulating cell-based matrixes

**SEE** Std/PBblas/Types.Layout\_Cell

### Children

1. [GetWorkItems](#) : Get a list of work-item ids from a matrix containing one or more work items
  2. [InsertCols](#) : Insert one or more columns of a fixed value into a matrix
  3. [Transpose](#) : Transpose a matrix This attribute supports the myriad interface
-

## FUNCTION GetWorkItems

MatUtils \

<b>DATASET(Layout_WI_ID)</b>	<b>GetWorkItems</b>
(DATASET(Layout_Cell) cells)	

Get a list of work-item ids from a matrix containing one or more work items

**PARAMETER** cells ||| TABLE ( Layout\_Cell ) — A matrix in Layout\_Cell format

**RETURN** TABLE ( { UNSIGNED2 wi\_id } ) — DATASET(Layout\_WI\_ID), one record per work-item

**SEE** PBblas/Types.Layout\_Cell

**SEE** PBblas/Types.Layout\_WI\_ID

---

## FUNCTION InsertCols

MatUtils \

<b>DATASET(Layout_Cell)</b>	<b>InsertCols</b>
(DATASET(Layout_Cell) M, UNSIGNED cols_to_insert=1, value_t insert_val=1)	

Insert one or more columns of a fixed value into a matrix. Columns are inserted before the first original column. This attribute supports the myriad interface. Multiple independent matrixes can be represented by M.

**PARAMETER** cols\_to\_insert ||| UNSIGNED8 — the number of columns to insert, default 1

**PARAMETER** insert\_val ||| REAL8 — the value for each cell of the new column(s), default 0

**PARAMETER** M ||| TABLE ( Layout\_Cell ) — the input matrix

**RETURN** TABLE ( { UNSIGNED2 wi\_id , UNSIGNED4 x , UNSIGNED4 y , REAL8 v } ) — matrix in Layout\_Cell format with additional column(s)

## FUNCTION Transpose

MatUtils \

<code>DATASET(Layout_Cell)</code>	<b>Transpose</b>
<code>(DATASET(Layout_Cell) M)</code>	

Transpose a matrix This attribute supports the myriad interface. Multiple independent matrixes can be represented by M.

**PARAMETER** M ||| TABLE ( Layout\_Cell ) — A matrix represented as DATASET(Layout\_Cell)

**RETURN** TABLE ( { UNSIGNED2 wi\_id , UNSIGNED4 x , UNSIGNED4 y , REAL8 v }  
 ) — Transposed matrix in Layout\_Cell format

## DESCRIPTIONS

### FUNCTION potrf

<code>DATASET(Layout_Cell)</code>	<code>potrf</code>
<code>(Triangle tri, DATASET(Layout_Cell) A_in)</code>	

Implements Cholesky factorization of  $A = U^{**T} * U$  if Triangulr.Upper requested or  $A = L * L^{**T}$  if Triangulr.Lower is requested. The matrix A must be symmetric positive definite.

$$\begin{array}{|cc|} \hline A11 & A12 \\ \hline A21 & A22 \\ \hline \end{array} == \begin{array}{|cc|} \hline L11 & 0 \\ \hline L21 & L22 \\ \hline \end{array} * \begin{array}{|cc|} \hline L11^{**T} & L21^{**T} \\ \hline 0 & L22 \\ \hline \end{array}$$
$$== \begin{array}{|cc|} \hline L11 * L11^{**T} & L11 * L21^{**T} \\ \hline L21 * L11^{**T} & L21 * L21^{**T} + L22 * L22^{**T} \\ \hline \end{array}$$

So, use Cholesky on the first block to get L11.  $L21 = A21 * L11^{**T} ** -1$  which can be found by dtrsm on each column block A22' is  $A22 - L21 * L21^{**T}$

Based upon PB-BLAS: A set of parallel block basic linear algebra subprograms by Choi and Dongarra

This module supports the "Myriad" style interface, allowing many independent problems to be worked on at once. The A matrix can contain multiple matrixes to be factored, indicated by different values for work-item id (wi\_id).

**PARAMETER** tri ||| UNSIGNED1 — Types.Triangle enumeration indicating whether we are looking for the Upper or the Lower factor

**PARAMETER** A\_in ||| TABLE ( Layout\_Cell ) — The matrix or matrixes to be factored in Types.Layout\_Cell format

**RETURN** TABLE ( { UNSIGNED2 wi\_id , UNSIGNED4 x , UNSIGNED4 y , REAL8 v } ) — Triangular matrix in Layout\_Cell format

## DESCRIPTIONS

### FUNCTION **trsm**

<code>DATASET(Layout_Cell)</code>	<b>trsm</b>
<code>(Side s, Triangle tri, BOOLEAN transposeA, Diagonal diag, value_t alpha, DATASET(Layout_Cell) A_in, DATASET(Layout_Cell) B_in)</code>	

Partitioned block parallel triangular matrix solver. Solves for X using:  $AX = B$  or  $XA = B$  A is a square triangular matrix, X and B have the same dimensions. A may be an upper triangular matrix ( $UX = B$  or  $XU = B$ ), or a lower triangular matrix ( $LX = B$  or  $XL = B$ ). Allows optional transposing and scaling of A. Partially based upon an approach discussed by MJ DAYDE, IS DUFF, AP CERFACS. A Parallel Block implementation of Level-3 BLAS for MIMD Vector Processors ACM Tran. Mathematical Software, Vol 20, No 2, June 1994 pp 178-193 and other papers about PB-BLAS by Choi and Dongarra This module supports the "Myriad" style interface, allowing many independent problems to be worked on at once. Corresponding A and B matrixes are related by a common work-item identifier (wi\_id) within each cell of the matrix. The returned X matrix will contain cells for the same set of work-items as specified for the A and B matrices.

**PARAMETER** alpha ||| REAL8 — Multiplier to scale A

**PARAMETER** A\_in ||| TABLE ( Layout\_Cell ) — The A matrix in Layout\_Cell format

**PARAMETER** diag ||| UNSIGNED1 — Types.Diagonal enumeration indicating whether A is a unit matrix or not. This is primarily used after factoring matrixes using getrf (LU factorization). That module produces a factored matrix stored within the same space as the original matrix. Since the diagonal is used by both factors, by convention, the Lower triangle has a unit matrix (diagonal all 1's) while the Upper triangle uses the diagonal cells. Setting this to UnitTri, causes the contents of the diagonal to be ignored, and assumed to be 1. NotUnitTri should be used for most other cases.

**PARAMETER** B\_in ||| TABLE ( Layout\_Cell ) — The B matrix in Layout\_Cell format

**PARAMETER** transposeA ||| BOOLEAN — Boolean indicating whether or not to transpose the A matrix before solving

**PARAMETER** tri ||| UNSIGNED1 — Types.Triangle enumeration indicating whether we are solving an Upper or Lower triangle.

**PARAMETER** s ||| UNSIGNED1 — Types.Side enumeration indicating whether we are solving  $AX = B$  or  $XA = B$

**RETURN** TABLE ( { UNSIGNED2 wi\_id , UNSIGNED4 x , UNSIGNED4 y , REAL8 v } ) — X solution matrix in Layout\_Cell format

**SEE** Types.Layout\_Cell

**SEE** Types.Triangle

**SEE** Types.Side

Types \

<b>t_mu_no</b>
----------------

Type for matrix universe number Allow up to 64k matrices in one universe

**RETURN** UNSIGNED2 —

## **RECORD** Layout\_Cell

Types \

<b>Layout_Cell</b>
--------------------

Layout for Matrix Cell Main representation of Matrix cell at interface to all PBBlas functions. Matrixes are represented as DATASET(Layout\_Cell), where each cell describes the row and column position of the cell as well as its value. Only the non-zero cells need to be contained in the dataset in order to describe the matrix since all unspecified cells are considered to have a value of zero. The cell also contains a work-item number that allows multiple separate matrixes to be carried in the same dataset. This supports the "myriad" style interface that allows the same operations to be performed on many different sets of data at once. Note that these matrixes do not have an explicit size. They are sized implicitly, based on the maximum row and column presented in the data. A matrix can be converted to an explicit dense form (see matrix\_t) by using the utility module MakeR8Set. This module should only be used for known small matrixes (< 1M cells) or for partitions of a larger matrix. The Converted module provides utility functions to convert to and from a set of partitions (See Layout\_parts).

**FIELD** x ||| UNSIGNED4 — 1-based row position within the matrix

**FIELD** v ||| REAL8 — Real value for the cell

**FIELD** wi\_id ||| UNSIGNED2 — Work Item Number – An identifier from 1 to 64K-1 that separates and identifies individual matrixes

**FIELD** y ||| UNSIGNED4 — 1-based column position within the matrix

**SEE** matrix\_t

**SEE** Std/PBblas/MakeR8Set.ecl

**SEE** Std/PBblas/Converted.ecl WARNING: Used as C++ attribute. Do not change without corresponding changes to MakeR8Set.

## RECORD Layout\_Norm

Types \

	Layout_Norm
--	-------------

Layout for Norm results.

**FIELD** wi\_id ||| UNSIGNED2 — Work Item Number – An identifier from 1 to 64K-1 that separates and identifies individual matrixes

**FIELD** v ||| REAL8 — Real value for the norm
