# Apply2Elements

## IMPORTS

PBblas | PBblas.Types | std.blas |

## DESCRIPTIONS

**FUNCTION** **Apply2Elements**

| `DATASET(Layout_Cell)` | **Apply2Elements** |
|---|---|
| `(DATASET(Layout_Cell) X, IElementFunc f)` | |

Apply a function to each element of the matrix Use PBblas.IElementFunc as the prototype function. Input and ouput may be a single matrix, or myriad matrixes with different work item ids.

**PARAMETER** **X** A matrix (or multiple matrices) in Layout_Cell form

**PARAMETER** **f** A function based on the IElementFunc prototype

**RETURN** A matrix (or multiple matrices) in Layout_Cell form

**SEE** PBblas/IElementFunc

**SEE** PBblas/Types.Layout_Cell

# asum

## IMPORTS

PBblas | PBblas.Types | PBblas.internal | PBblas.internal.Types |

## DESCRIPTIONS

**FUNCTION** **asum**

| DATASET(Layout_Norm) | **asum** |
|---|---|
| (DATASET(Layout_Cell) X) | |

Absolute sum – the "Entrywise" 1-norm Compute SUM(ABS(X))

**PARAMETER** $\underline{X}$ Matrix or set of matrices in Layout_Cell format

**RETURN** DATASET(Layout_Norm) with one record per work item

**SEE** PBblas/Types.Layout_Cell

# axpy

## IMPORTS

PBblas | PBblas.Types |

## DESCRIPTIONS

**FUNCTION** **axpy**

| `DATASET(Layout_Cell)` | **axpy** |
|---|---|
| `(value_t alpha, DATASET(Layout_Cell) X, DATASET(Layout_Cell) Y)` | |

Implements alpha*X + Y X and Y must have same shape

**PARAMETER** **alpha** Scalar multiplier for the X matrix

**PARAMETER** **X** X matrix in DATASET(Layout_Cell) form

**PARAMETER** **Y** Y matrix in DATASET(Layout_Call) form

**RETURN** Matrix in DATASET(Layout_Cell) form

**SEE** PBblas/Types.layout_cell

# Converted

## IMPORTS

PBblas | PBblas.Types | ML_Core.Types |

## DESCRIPTIONS

**MODULE** **Converted**

| | Converted |
|---|---|

Module to convert between ML_Core/Types Field layouts (i.e. NumericField and DiscreteField) and PBblas matrix layout (i.e. Layout_Cell)

**Children**

1. NFToMatrix : Convert NumericField dataset to Matrix

2. DFToMatrix : Convert DiscreteField dataset to Matrix

3. MatrixToNF : Convert Matrix to NumericField dataset

4. MatrixToDF : Convert Matrix to DiscreteField dataset

## FUNCTION NFToMatrix

Converted \

| DATASET(Layout_Cell) | **NFToMatrix** |
|---|---|
| (DATASET(NumericField) recs) | |

Convert NumericField dataset to Matrix

**PARAMETER** <u>recs</u> Record Dataset in DATASET(NumericField) format

**RETURN** Matrix in DATASET(Layout_Cell) format

**SEE** PBblas/Types.Layout_Cell

**SEE** ML_Core/Types.NumericField

## FUNCTION DFToMatrix

Converted \

| DATASET(Layout_Cell) | **DFToMatrix** |
|---|---|
| (DATASET(DiscreteField) recs) | |

Convert DiscreteField dataset to Matrix

**PARAMETER** <u>recs</u> Record Dataset in DATASET(DiscreteField) format

**RETURN** Matrix in DATASET(Layout_Cell) format

**SEE** PBblas/Types.Layout_Cell

**SEE** ML_Core/Types.DiscreteField

## **FUNCTION** **MatrixToNF**

| DATASET(NumericField) | **MatrixToNF** |
|---|---|
| (DATASET(Layout_Cell) mat) | |

Convert Matrix to NumericField dataset

**PARAMETER**  **mat** Matrix in DATASET(Layout_Cell) format

**RETURN**  NumericField Dataset

**SEE**  PBblas/Types.Layout_Cell

**SEE**  ML_Core/Types.NumericField

## **FUNCTION** **MatrixToDF**

| DATASET(DiscreteField) | **MatrixToDF** |
|---|---|
| (DATASET(Layout_Cell) mat) | |

Convert Matrix to DiscreteField dataset

**PARAMETER**  **mat** Matrix in DATASET(Layout_Cell) format

**RETURN**  DiscreteField Dataset

**SEE**  PBblas/Types.Layout_Cell

**SEE**  ML_Core/Types.DiscreteField

# ExtractTri

## IMPORTS

PBblas | std.blas | PBblas.Types | PBblas.internal | PBblas.internal.Types | PBblas.internal.MatDims | PBblas.internal.Converted |

## DESCRIPTIONS

### FUNCTION **ExtractTri**

| DATASET(Layout_Cell) | **ExtractTri** |
|---|---|
| (Triangle tri, Diagonal dt, DATASET(Layout_Cell) A) ||

Extract the upper or lower triangle from the composite output from getrf (LU Factorization).

**PARAMETER** **tri** Triangle type: Upper or Lower (see Types.Triangle)

**PARAMETER** **dt** Diagonal type: Unit or non unit (see Types.Diagonal)

**PARAMETER** **A** Matrix of cells. See Types.Layout_Cell

**RETURN** Matrix of cells in Layout_Cell format representing a triangular matrix (upper or lower)

**SEE** Std.PBblas.Types

# gemm

## IMPORTS

PBblas | PBblas.Types | PBblas.internal | PBblas.internal.Types | std.blas |
PBblas.internal.MatDims | std.system.Thorlib |

## DESCRIPTIONS

### FUNCTION gemm

| DATASET(Layout_Cell) | gemm |
|---|---|
| (BOOLEAN transposeA, BOOLEAN transposeB, value_t alpha, DATASET(Layout_Cell) A_in, DATASET(Layout_Cell) B_in, DATASET(Layout_Cell) C_in=emptyC, value_t beta=0.0) | |

Extended Parallel Block Matrix Multiplication Module Implements: Result = alpha * op(A)op(B) + beta
* C. op is No Transpose or Transpose. Multiplies two matrixes A and B, with an optional pre-multiply
transpose for each Optionally scales the product by the scalar "alpha". Then adds an optional C matrix
to the product after scaling C by the scalar "beta". A, B, and C are specified as DATASET(Layout_Cell),
as is the Resulting matrix. Layout_Cell describes a sparse matrix stored as a list of x, y, and value. This
interface also provides a "Myriad" capability allowing multiple similar operations to be performed on
independent sets of matrixes in parallel. This is done by use of the work-item id (wi_id) in each cell of
the matrixes. Cells with the same wi_id are considered part of the same matrix. In the myriad form,
each input matrix A, B, and (optionally) C can contain many independent matrixes. The wi_ids are
matched up such that each operation involves the A, B, and C with the same wi_id. A and B must
therefore contain the same set of wi_ids, while C is optional for any wi_id. The same parameters: alpha,
beta, transposeA, and transposeB are used for all work-items. The result will contain cells from all
provided work-items. Result has same shape as C if provided. Note that matrixes are not explicitly

dimensioned. The shape is determined by the highest value of x and y for each work-item.

**PARAMETER** **transposeA** Boolean indicating whether matrix A should be transposed before multiplying

**PARAMETER** **transposeB** Same as above but for matrix B

**PARAMETER** **alpha** Scalar multiplier for alpha * A * B

**PARAMETER** **A_in** 'A' matrix (multiplier) in Layout_Cell format

**PARAMETER** **B_in** Same as above for the 'B' matrix (multiplicand)

**PARAMETER** **C_in** Same as above for the 'C' matrix (addend). May be omitted.

**PARAMETER** **beta** A scalar multiplier for beta * C, scales the C matrix before addition. May be omitted.

**RETURN** Result matrix in Layout_Cell format.

**SEE** PBblas/Types.Layout_Cell

# getrf

---

## IMPORTS

PBblas | PBblas.Types | PBblas.internal | PBblas.internal.Types | std.blas |
PBblas.internal.MatDims | std.system.Thorlib |

## DESCRIPTIONS

**FUNCTION** getrf

| DATASET(Layout_Cell) | getrf |
| --- | --- |
| (DATASET(Layout_Cell) A) | |

LU Factorization Splits a matrix into Lower and Upper triangular factors Produces composite LU matrix for the diagonal blocks. Iterates through the matrix a row of blocks and column of blocks at a time. Partition A into M block rows and N block columns. The A11 cell is a single block. A12 is a single row of blocks with N-1 columns. A21 is a single column of blocks with M-1 rows. A22 is a sub-matrix of M-1 x N-1 blocks. | A11 A12 | | L11 0 | | U11 U12 | | A21 A22 | == | L21 L22 | * | 0 U22 | | L11*U11 L11*U12 | == | L21*U11 L21*U12 + L22*U22 | Based upon PB-BLAS: A set of parallel block basic linear algebra subprograms by Choi and Dongarra This module supports the "Myriad" style interface, allowing many independent problems to be worked on at once. The A matrix can contain multiple matrixes to be factored, indicated by different values for work-item id (wi_id). Note: The returned matrix includes both the upper and lower factors. This matrix can be used directly by trsm which will only use the part indicated by trsm's 'triangle' parameter (i.e. upper or lower). To extract the upper or lower triangle explicitly for other purposes, use the ExtractTri function. When passing the Lower matrix to the triangle solver (trsm), set the "Diagonal" parameter to "UnitTri". This is necessary because both triangular matrixes returned from this function are packed into a square matrix with only one diagonal. By convention, The Lower triangle is assumed to be a Unit Triangle (diagonal all ones), so the diagonal

contained in the returned matrix is for the Upper factor and must be ignored (i.e. assumed to be all ones) when referencing the Lower triangle.

**PARAMETER** **A** The input matrix in Types.Layout_Cell format

**RETURN** Resulting factored matrix in Layout_Cell format

**SEE** Types.Layout_Cell

**SEE** ExtractTri

# HadamardProduct

## IMPORTS

PBblas | PBblas.internal | PBblas.internal.MatDims | PBblas.Types |
PBblas.internal.Types | PBblas.internal.Converted | std.blas | std.system.Thorlib |

## DESCRIPTIONS

**FUNCTION** **HadamardProduct**

| `DATASET(Layout_Cell)` | **HadamardProduct** |
|---|---|
| `(DATASET(Layout_Cell) X, DATASET(Layout_Cell) Y)` | |

Element-wise multiplication of X * Y. Supports the "myriad" style interface – X and Y may contain multiple separate matrixes. Each X will be multiplied by the Y with the same work-item id. Note: This performs element-wise multiplication. For dot-product matrix multiplication, use PBblas.gemm.

**PARAMETER** **X** A matrix (or multiple matrices) in Layout_Cell form

**PARAMETER** **Y** A matrix (or multiple matrices) in Layout_Cell form

**RETURN** A matrix (or multiple matrices) in Layout_Cell form

**SEE** PBblas/Types.Layout_Cell

# IElementFunc

## IMPORTS

PBblas |

## DESCRIPTIONS

**FUNCTION** **IElementFunc**

| `value_t` | **IElementFunc** |
|-----------|------------------|
| `(value_t v, dimension_t r, dimension_t c)` | |

Function prototype for a function to apply to each element of the distributed matrix Base your function on this prototype:

**PARAMETER** **v** Input value

**PARAMETER** **r** Row number (1 based)

**PARAMETER** **c** Column number (1 based)

**RETURN** Output value

**SEE** PBblas/Apply2Elements

# MatUtils

## IMPORTS

PBblas | PBblas.Types | PBblas.internal | PBblas.internal.Types | PBblas.internal.MatDims |

## DESCRIPTIONS

**MODULE** **MatUtils**

| MatUtils |
| --- |

Provides various utility attributes for manipulating cell-based matrixes

**SEE** Std/PBblas/Types.Layout_Cell

**Children**

1. GetWorkItems : Get a list of work-item ids from a matrix containing one or more work items

2. InsertCols : Insert one or more columns of a fixed value into a matrix

3. Transpose : Transpose a matrix This attribute supports the myriad interface

## FUNCTION GetWorkItems

| `DATASET(Layout_WI_ID)` | **GetWorkItems** |
|---|---|
| `(DATASET(Layout_Cell) cells)` | |

Get a list of work-item ids from a matrix containing one or more work items

**PARAMETER** <u>**cells**</u> A matrix in Layout_Cell format

**RETURN** DATASET(Layout_WI_ID), one record per work-item

**SEE** PBblas/Types.Layout_Cell

**SEE** PBblas/Types.Layout_WI_ID

## FUNCTION InsertCols

| `DATASET(Layout_Cell)` | **InsertCols** |
|---|---|
| `(DATASET(Layout_Cell) M, UNSIGNED cols_to_insert=1, value_t insert_val=1)` | |

Insert one or more columns of a fixed value into a matrix. Columns are inserted before the first original column. This attribute supports the myriad interface. Multiple independent matrixes can be represented by M.

**PARAMETER** <u>**M**</u> the input matrix

**PARAMETER** <u>**cols_to_insert**</u> the number of columns to insert, default 1

**PARAMETER** <u>**insert_val**</u> the value for each cell of the new column(s), default 0

**RETURN** matrix in Layout_Cell format with additional column(s)

## **FUNCTION** Transpose

| `DATASET(Layout_Cell)` | **Transpose** |
|---|---|
| `(DATASET(Layout_Cell) M)` | |

Transpose a matrix This attribute supports the myriad interface. Multiple independent matrixes can be represented by M.

**PARAMETER** <u>M</u> A matrix represented as DATASET(Layout_Cell)

**RETURN** Transposed matrix in Layout_Cell format

**SEE** PBblas/Types.Layout_Cell

# PBblas/
# potrf

[Go Up](#)

## IMPORTS

PBblas | PBblas.Types | std.blas | PBblas.internal | PBblas.internal.Types |
PBblas.internal.MatDims | PBblas.internal.Converted | std.system.Thorlib |

## DESCRIPTIONS

### FUNCTION potrf

| DATASET(Layout_Cell) | potrf |
|---|---|
| (Triangle tri, DATASET(Layout_Cell) A_in) | |

Implements Cholesky factorization of A = U**T * U if Triangular.Upper requested or A = L * L**T if Triangualr.Lower is requested. The matrix A must be symmetric positive definite.

```
 | A11   A12 |        | L11    0  |     | L11**T     L21**T |
 | A21   A22 | ==  |   L21   L22 | * | 0              L22 |

                     | L11*L11**T         L11*L21**T      |
              ==  | L21*L11**T  L21*L21**T + L22*L22**T |
```

So, use Cholesky on the first block to get L11. L21 = A21*L11**T**-1 which can be found by dtrsm on each column block A22' is A22 - L21*L21**T

Based upon PB-BLAS: A set of parallel block basic linear algebra subprograms by Choi and Dongarra

This module supports the "Myriad" style interface, allowing many independent problems to be worked on at once. The A matrix can contain multiple matrixes to be factored, indicated by different values for work-item id (wi_id).

**PARAMETER** **tri** Types.Triangle enumeration indicating whether we are looking for the Upper or the Lower factor

**PARAMETER** **A_in** The matrix or matrixes to be factored in Types.Layout_Cell format

**RETURN** Triangular matrix in Layout_Cell format

**SEE** Std.PBblas.Types.Layout_Cell

**SEE** Std.PBblas.Types.Triangle

# scal

## IMPORTS

PBblas | PBblas.Types |

## DESCRIPTIONS

**FUNCTION** **scal**

| `DATASET(Layout_Cell)` | **scal** |
|---|---|
| `(value_t alpha, DATASET(Layout_Cell) X)` | |

Scale a matrix by a constant Result is alpha * X This supports a "myriad" style interface in that X may be a set of independent matrices separated by different work-item ids.

**PARAMETER** **alpha** A scalar multiplier

**PARAMETER** **X** The matrix(es) to be scaled in Layout_Cell format

**RETURN** Matrix in Layout_Cell form, of the same shape as X

**SEE** PBblas/Types.Layout_Cell

# tran

## IMPORTS

## DESCRIPTIONS

**FUNCTION** **tran**

| DATASET(Layout_Cell) | **tran** |
|---|---|
| (value_t alpha, DATASET(Layout_Cell) A, value_t beta=0, DATASET(Layout_Cell) C=empty_c) | |

Transpose a matrix and sum into base matrix result <== alpha * A**t + beta * C, A is n by m, C is m
by n A**T (A Transpose) and C must have same shape

**PARAMETER** **alpha** Scalar multiplier for the A**T matrix

**PARAMETER** **A** A matrix in DATASET(Layout_Cell) form

**PARAMETER** **beta** Scalar multiplier for the C matrix

**PARAMETER** **C** C matrix in DATASET(Layout_Call) form

**RETURN** Matrix in DATASET(Layout_Cell) form alpha * A**T + beta * C

**SEE** PBblas/Types.layout_cell

# trsm

## IMPORTS

PBblas | PBblas.Types | std.blas | PBblas.internal | PBblas.internal.Types |

PBblas.internal.MatDims | PBblas.internal.Converted | std.system.Thorlib |

## DESCRIPTIONS

### FUNCTION trsm

| DATASET(Layout_Cell) | trsm |
|---|---|
| (Side s, Triangle tri, BOOLEAN transposeA, Diagonal diag, value_t alpha, DATASET(Layout_Cell) A_in, DATASET(Layout_Cell) B_in) | |

Partitioned block parallel triangular matrix solver. Solves for X using: AX = B or XA = B A is is a square triangular matrix, X and B have the same dimensions. A may be an upper triangular matrix (UX = B or XU = B), or a lower triangular matrix (LX = B or XL = B). Allows optional transposing and scaling of A. Partially based upon an approach discussed by MJ DAYDE, IS DUFF, AP CERFACS. A Parallel Block implementation of Level-3 BLAS for MIMD Vector Processors ACM Tran. Mathematical Software, Vol 20, No 2, June 1994 pp 178-193 and other papers about PB-BLAS by Choi and Dongarra This module supports the "Myriad" style interface, allowing many independent problems to be worked on at once. Corresponding A and B matrixes are related by a common work-item identifier (wi_id) within each cell of the matrix. The returned X matrix will contain cells for the same set of work-items as specified for the A and B matrices.

**PARAMETER** s Types.Side enumeration indicating whether we are solving AX = B or XA = B

**PARAMETER** <u>**tri**</u> Types.Triangle enumeration indicating whether we are solving an Upper or Lower triangle.

**PARAMETER** <u>**transposeA**</u> Boolean indicating whether or not to transpose the A matrix before solving

**PARAMETER** <u>**diag**</u> Types.Diagonal enumeration indicating whether A is a unit matrix or not. This is primarily used after factoring matrixes using getrf (LU factorization). That module produces a factored matrix stored within the same space as the original matrix. Since the diagonal is used by both factors, by convention, the Lower triangle has a unit matrix (diagonal all 1's) while the Upper triangle uses the diagonal cells. Setting this to UnitTri, causes the contents of the diagonal to be ignored, and assumed to be 1. NotUnitTri should be used for most other cases.

**PARAMETER** <u>**alpha**</u> Multiplier to scale A

**PARAMETER** <u>**A_in**</u> The A matrix in Layout_Cell format

**PARAMETER** <u>**B_in**</u> The B matrix in Layout_Cell format

**RETURN** X solution matrix in Layout_Cell format

**SEE** Types.Layout_Cell

**SEE** Types.Triangle

**SEE** Types.Side

Type for matrix universe number Allow up to 64k matrices in one universe

---

## RECORD Layout_Cell

Types \

| Layout_Cell |
| --- |

Layout for Matrix Cell Main representation of Matrix cell at interface to all PBBlas functions. Matrixes are represented as DATASET(Layout_Cell), where each cell describes the row and column position of the cell as well as its value. Only the non-zero cells need to be contained in the dataset in order to describe the matrix since all unspecified cells are considered to have a value of zero. The cell also contains a work-item number that allows multiple separate matrixes to be carried in the same dataset. This supports the "myriad" style interface that allows the same operations to be performed on many different sets of data at once. Note that these matrixes do not have an explicit size. They are sized implicitly, based on the maximum row and column presented in the data. A matrix can be converted to an explicit dense form (see matrix_t) by using the utility module MakeR8Set. This module should only be used for known small matrixes (< 1M cells) or for partitions of a larger matrix. The Converted module provides utility functions to convert to and from a set of partitions (See Layout_parts).

**FIELD** **wi_id** Work Item Number – An identifier from 1 to 64K-1 that separates and identifies individual matrixes

**FIELD** **x** 1-based row position within the matrix

**FIELD** **y** 1-based column position within the matrix

**FIELD** **v** Real value for the cell

**SEE** matrix_t

**SEE** Std/PBblas/MakeR8Set.ecl

**SEE** Std/PBblas/Converted.ecl WARNING: Used as C++ attribute. Do not change without corresponding changes to MakeR8Set.

---

## **RECORD** **Layout_Norm**

Types \

| Layout_Norm |
|---|

Layout for Norm results.

**FIELD** **wi_id** Work Item Number – An identifier from 1 to 64K-1 that separates and identifies individual matrixes

**FIELD** **v** Real value for the norm

---

# Vector2Diag

## IMPORTS

PBblas | PBblas.internal | PBblas.internal.MatDims | PBblas.Types | PBblas.internal.Types | PBblas.Constants |

## DESCRIPTIONS

**FUNCTION** **Vector2Diag**

| `DATASET(Layout_Cell)` | **Vector2Diag** |
|---|---|
| `(DATASET(Layout_Cell) X)` | |

Convert a vector into a diagonal matrix. The typical notation is D = diag(V). The input X must be a 1 x N column vector or an N x 1 row vector. The resulting matrix, in either case will be N x N, with zero everywhere except the diagonal.

**PARAMETER** **X** A row or column vector (i.e. N x 1 or 1 x N) in Layout_Cell format

**RETURN** An N x N matrix in Layout_Cell format

**SEE** PBblas/Types.Layout_cell
